Xg-Boost regressor	all Byte features+ all asm features with pixel intensity	best alpha = 500	0.013649910888358836
Xg-Boost regressor-with randomcv	all Byte features+ all asm features with pixel intensity+asm opcode feature	best alpha = 200	0.014017224659044626

For this assignment, I got best solution to get the high configuration in google colab.

(Solution:Open 25 GB RAM GPU notebook file on colab and shift the runtime type to TPU.In this we get **35 GB RAM and 107 GB storage space** and it has time limit of 12 hours.)

Byte file feature:Unigram,bigram and file size: As file side is 48GB, I have downloaded byte files on Colab only and for the processing of bigrams, I have used multithreading concept. as number of files are 10868, created 22 processes(494 files each process will run parallelly) and total processing time for bigram vectors is reduced from 3 hours to 16 mins only.

Using byte features,got best test loss value **0.06937996925615564**

For asm pixel intensity feature and asm file features, file size was large(more than 100 GB)so mounted 200 GB google drive(paid subscription which I already have) and downloaded all asm files on mounted Gdrive. Using asm file, extracted png files using multithreading concept(47 mins to create all 10868 images(22 processes, 494 files each process))

Using asm pixel intensity of first 200 pixel and using asm keyword feature,got log loss of **0.031523435164007935**

For all asm feature and byte file featurescombining both the above feature, loss reduced to **0.02993039632795083**

For all asm feature,byte file features plus asm opcode feature For opcode feature, used same files from gdrive and for the text file opcodes fetching logic, I have used multithreding.In the end combined all opcodes in one file. this entire **process took 43min 11s** to get all opcodes.Opcode feature has great impact on loss and finally got test loss **0.014017224659044626**.
